HAUG Ionization for the elimination of electrostatic charges

S-Line ionizing bar EI SL

Thanks to its state-of-the-art ionization technology, the HAUG El SL ionizing bar is setting new standards: Ensuring an optimal neutralizing effect, it eliminates electrostatic charges during roll, sheet and web processing (ill. 1 and 2).

Special features and advantages

The extensive development of the S-Line ionizing bar offers many advantages, especially to the application technology.

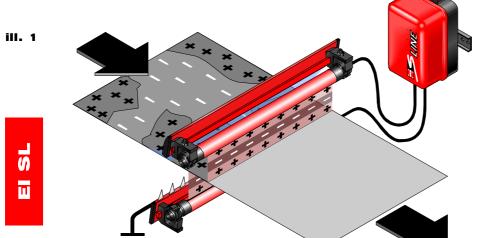

- Modern tailor-made industrial design: The round construction of the ionizing bar, in combination with the special HAUG brackets (photo 1), permits the exact axial adjustment to the material web. The ionizing bar so always offers the optimal amount of positive and negative ions to the material to be neutralized.
- Tailor-made technology: The outstanding HAUG engineering technology stands for high quality. This technology prevents disturbances as well as loss of production and produces a considerable saving of both time and expenses over the medium term.
- Tailor-made accessories: The HAUG System X-2000 coaxial high-voltage plug connection offers unique benefits. The gastight high-voltage plug can be connected to HAUG power packs without tools. The flexible coaxially shielded cable is used to connect the ionizing bar to the voltage supply source (ill. 3 and 4).

EI SL / CI SL

Passive ionizer

The passive ionizer CI SL completes active ionizing units. It is an efficient pre-ionizer, especially for high charges. Passive ionizers are metallic pins which are connected to earth. When a passive ionizer is moved towards a charged material, an ion-producing corona discharge is induced in the pins of the ionizer. The neutralizing effect of a passive ionizer is particularly recommended in combination with an active ionizing unit. The passive ionizer works independently of power supply.

ill. 2 Discharge effective distance optimum eff 20 - 30 mm

Applications

Today, HAUG ionizing bars are indispensable to the packaging, film/foil, printing and textile industries as well as for many other industrial applications.

Recommendations

The EI SL ionizing bar is suitable for feed speeds up to 100 m/min.

In order to ensure high efficiency and trouble-free production, we recommend that two ionizing bars be installed (above and below the material web. ill. 1), particularly during foil processing.

S-Line ionization system

The S-Line Power Pack **EN SL** provides the ionizer with approx. 7 - 8 kV alternating current by means of the integrated highvoltage transformer. The various ionizers are connected to the power pack.

The S-Line LC power pack comes with a signal lamp to monitor the high voltage.
